Subject: Please increase solar FiT (please delete previous email)

To whom it may concern,

My previous email was poorly formatted - here is a correct version.

The current FiT for solar is nowhere near adequate to provide a financial incentive for consumers to install solar panels. Increasing it considerably would have numerous benefits including:

- Helping to address the current energy crisis in Tasmania.
- Providing more affordable power to consumers (especially in the current situation with the alternative expensive options of diesel and gas)
- The obvious, and very important, environmental benefits of clean energy.
- In the long term, more renewable energy could be a great financial asset to the state.
- With our hydro plus the largely untapped potential for wind and solar, Tassie could easily be leading the way in renewable energy within Australia, being fully self sufficient as well as exporting power and attracting industry to the state. As a Tasmanian, this is something I (and I'm sure many others) would take great pride in. We should be embracing the opportunity to put Tassie on the map as a leader in this area.

With the current global focus on climate change and our own local power problems, now is the time for change. Please encourage Tasmanians to adopt solar by increasing the FiT to a fairer price.

Regards

Eve White
